<td>192</td>
<td>192</td>
<td>192</td>
<td>192</td>
</tr>
</tbody>
</table>

a) Is this a short run or long run information on cost? Why?

b) If the price of the good produced is currently 19, what level of output meets the profit maximizing condition?

c) Draw a figure illustrating the average cost, the average variable cost, and the marginal cost curves based on the information in this table. Explain your answer to (b) in reference to this graph.
2) Production and cost functions. (2 points)

a. \( Q = f(L, K) \) is the production function. Define the marginal product of labor and the average product of labor for this production function.

b. Explain why this production function will exhibit diminishing marginal product as \( L \) increases.

c. If the cost of the input of labor \( L \) is $5 per unit, calculate the cost of producing each level of output, and the marginal cost for changing the output level.

<table>
<thead>
<tr>
<th>Input level L</th>
<th>Output level Q</th>
<th>Cost of producing Q</th>
<th>Change in Q</th>
<th>Change in cost</th>
<th>Marginal Cost</th>

</table>
3) Circle the correct answer.

<table>
<thead>
<tr>
<th>Statement</th>
<th>The statement is (circle the correct answer)</th>
</tr>
</thead>
<tbody>
<tr>
<td>The slope of the total cost curve is called the marginal rate of technical substitution.</td>
<td>True</td>
</tr>
<tr>
<td>Producer surplus is calculated as the area under the demand curve and above the price line.</td>
<td>True</td>
</tr>
<tr>
<td>In a perfectly competitive market the firm is a price taker.</td>
<td>True</td>
</tr>
<tr>
<td>If where price = MC(q), price is less than average variable cost, the firm should shut down and produce q=0 in the short run.</td>
<td>True</td>
</tr>
<tr>
<td>Marginal cost = cost of the input / marginal product.</td>
<td>True</td>
</tr>
<tr>
<td>The bisection rule allows us to derive the marginal cost curve from a linear demand curve.</td>
<td>True</td>
</tr>
<tr>
<td>According to the last dollar rule, the marginal products of capital and labor should be equal.</td>
<td>True</td>
</tr>
<tr>
<td>The expansion path traces out input bundles that maximize output for given cost levels.</td>
<td>True</td>
</tr>
</tbody>
</table>
4) You are given the following information on the relationship between inputs and production level at various points.

<table>
<thead>
<tr>
<th>Points</th>
<th>Labor</th>
<th>Capital</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>10</td>
<td>20</td>
<td>200</td>
</tr>
<tr>
<td>B</td>
<td>20</td>
<td>40</td>
<td>500</td>
</tr>
<tr>
<td>C</td>

<td>160</td>
<td>1800</td>
</tr>
<tr>
<td>E</td>
<td>160</td>
<td>320</td>
<td>2500</td>
</tr>
</tbody>
</table>

a. Illustrate these points using isoquants.

b. Contrast the returns to scale implied by movement between the points. (circle the correct answer)
From a to b I have (increasing, constant, decreasing) returns to scale.
From b to c I have (increasing, constant, decreasing) returns to scale.
From c to d I have (increasing, constant, decreasing) returns to scale.
From d to e I have (increasing, constant, decreasing) returns to scale.
5) You know that the demand curve is defined by the following function: $P = 80 - 5Q$.
   a. Use the bisection rule to define the marginal revenue curve
   
   b. If total cost is defined by $10Q$, then you know $MC$ is $10$ for all possible levels of $Q$. What is the value of Average Cost? Explain.
   
   c. At what $Q$ do marginal cost and marginal revenue cross?
   
   d. What is the selling price for a monopolist?
   
   e. Why is the firm not better off setting $Q = 0$ and shutting down rather than producing at the $Q$ you noted in (c)? Explain your reasoning briefly
6) Continue with the demand curve from (5) and the MC=10 supply curve. Assume the market for this commodity was to become a perfectly competitive market for some reason.

   a. What are the market price and amount of quantity in the market if all firms in the competitive market had identical cost structures to the monopoly firm (MC=10) and the demand curve was unchanged?

   b. Show the competitive case in comparison to the monopoly case on a single graph.

   c. Calculate the magnitude of the deadweight loss of monopoly and explain the meaning of deadweight loss.
7) Production.
a) \(Q = f(L, K)\) is the production function with \(L\) as labor and \(K\) as a fixed level of capital. Draw this production function and illustrate areas that are: technologically infeasible, technologically efficient, and technologically inefficient.

b) \(Q = f(L, K)\) is the production function with both labor and capital variable. Draw an isoquant for the quantity \(Q_1\) and illustrate areas that are: technologically infeasible for producing \(Q_1\), technologically efficient for producing \(Q_1\), and technologically inefficient for producing \(Q_1\).

c) \(Q = f(L, K)\) is the production function with both labor and capital variable. Use this production function to illustrate the concepts of constant and decreasing returns to scale.
8) Assume the rental rate of capital is 4 and the wage rate is 6.
   a. Draw an isocost curve for a total cost level of 120.

   b. If the marginal product of labor is 3, what is the marginal product of capital at an economically efficient point? Why?

   c. What values define the slope of an isocost?
9) Circle the correct answer

<table>
<thead>
<tr>
<th>Condition A</th>
<th>Condition B</th>
<th>What type of condition is B for establishing A?</th>
</tr>
</thead>
<tbody>
<tr>
<td>MC is above AC at q</td>
<td>AC is upward sloping at q</td>

</tr>
</tbody>
</table>

N, NS: Necessary, not sufficient
S, NN: Sufficient, not necessary
N, S: Necessary and sufficient.
10) Supply curves and firm costs.
   a. Illustrate where we find the firm specific supply curves for two firms who differ in costs in the short run. Note for each firm average fixed costs, average variable costs, average costs, and marginal costs. Use two graphs, side by side, one for each firm.

b. Explain how these individual firm supply curves aggregate to become the market supply curve.

c. Explain the concept of producer surplus based on your answers to a and b.
